## ANEXO

Guayaquil, April 19th, 2021

### Press Release

SYCAR announces today that the Ministry of Environment and Water of Ecuador, through document No. MAAE-DZ7-2021-1307-O dated April 19th, 2021, has granted SYCAR final approval to Environmental Impact Study for our LNG import terminal in Ecuador.

The resolution issued by the Ministry of Environment and Water of Ecuador marks the completion of the permits phase of the project, the final action on our hand is to present the government with proof of payment of the environmental license tax and the certificate of environmental coverage toward the issuance of the environmental license.

SYCAR's project is for the development of the first LNG import terminal for Ecuador, South America. The project includes marine facilities for the berthing of an a FSRU to supply RLNG to the Ecuadorian market.

This project is intended to introduce Natural Gas to the Ecuadorian energy mix as an option to substitute the use of other Liquid Hydrocarbons.

The project is being developed in Bajo Alto, El Oro Province, this is a privileged location, with natural water depths of 36 feet on sheltered inland waters.

The terminal location has been assessed from a maritime point of view and it benefits of benign conditions to work 365 days a year, as of today the project has been awarded a concession from the Undersecretary of Ports as well as the FSRU operation approval from the Secretary for the Regulation and Control of Hydrocarbons in Ecuador.

This final milestone maintains the project on track with the original schedule giving a positive sign to Ecuadorian industrial customers of the future ample availability of LNG volumes beyond the domestic offer.

This milestone is also good news for our project and a step towards the construction of the first LNG import terminal in Ecuador.
